Condensed Matter Physics

Institute for Theoretical Solid State Physics

Institute for Theory of Statistical Physics

Institute for Quantum Information

SFB 917

ML4Q
Matter and Light for Quantum Computing

Research Training Group: Quantum Many-Body Methods in Condensed Matter Systems

Electronic Hamiltonian

$$H = \sum_i \frac{p_i^2}{2m} + \frac{1}{2}\sum_{i \neq j} \frac{e^2}{\left|\boldsymbol{r}_i - \boldsymbol{r}_j\right|} + \sum_i V\left(\boldsymbol{r}_i\right)$$

+ external electric and magnetic fields

+ relativistic corrections

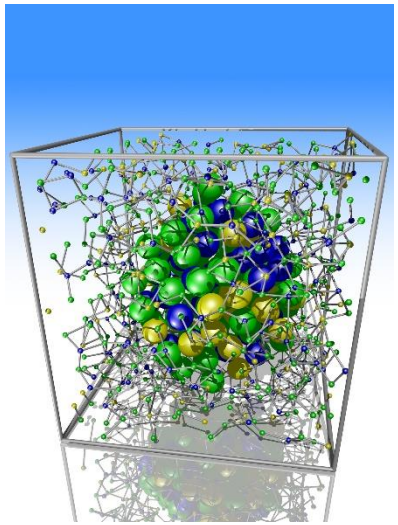
Institute for Theoretical Solid State Physics

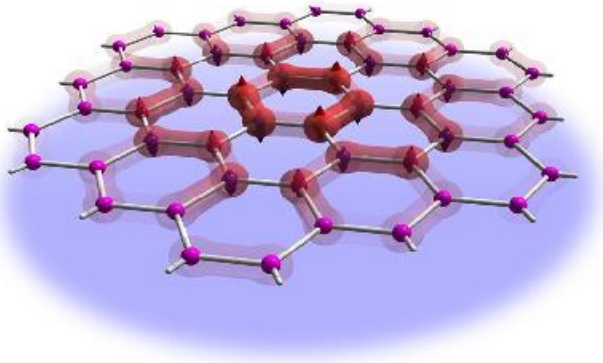
(Honerkamp, Wessel, Schmitz, Mazzarello)

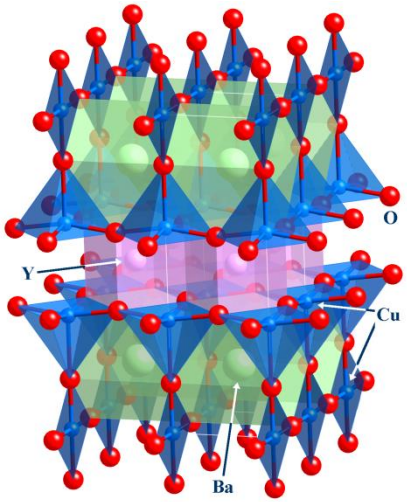
Themes: - Magnetism, superconductivity, novel functional and 2D materials, soft matter

- Topological phases of matter

- Computational and field theoretical methods



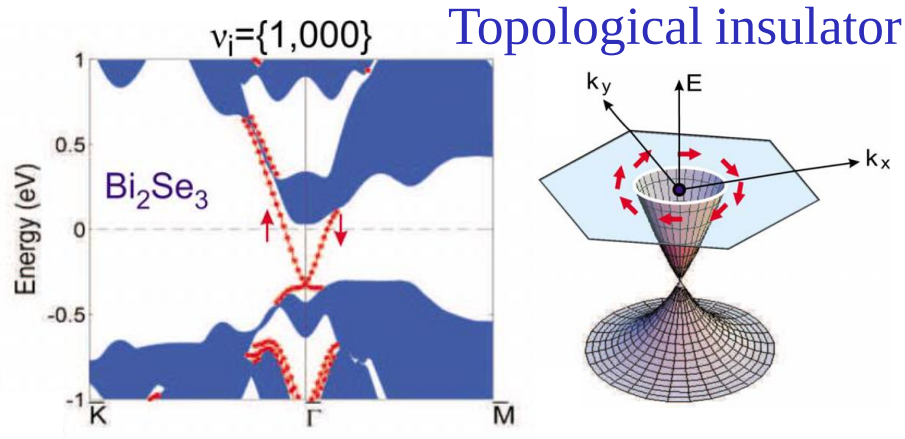


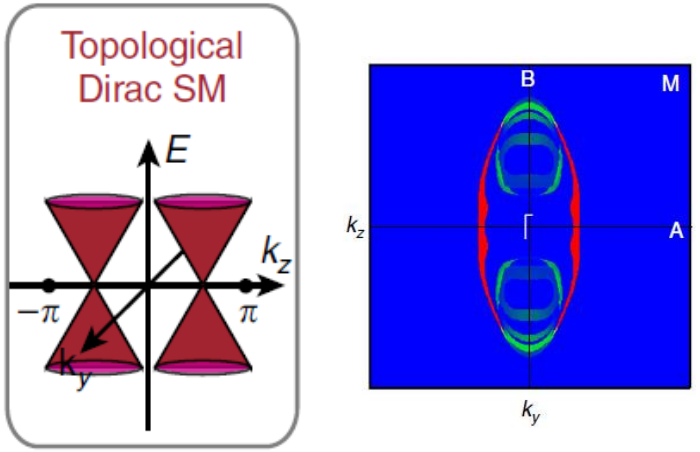


Topological insulators and semimetals

- Topological insulators are insulators with interesting "exotic" properties, such as conducting surface states

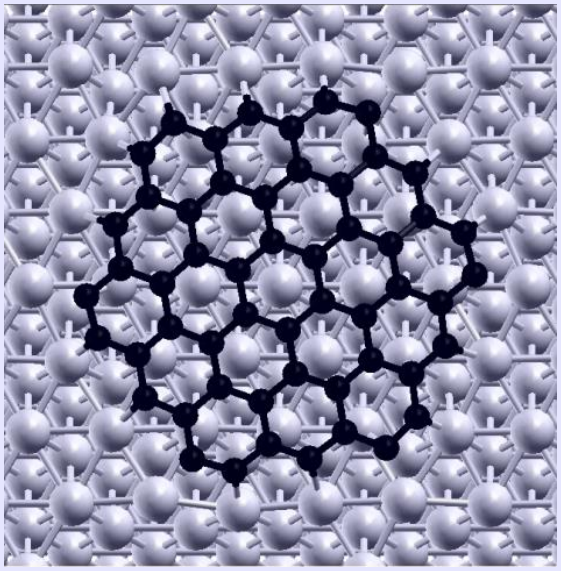
- Topological Dirac semimetals exhibit "protected" 3D Dirac cones



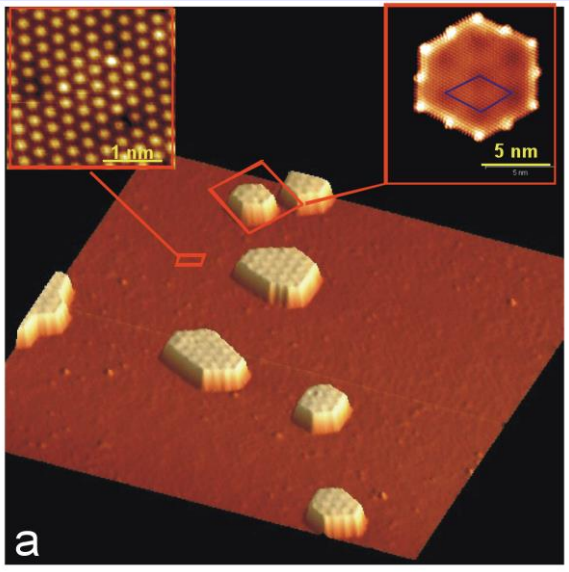


Edge magnetism in graphene nanostructures

- Zigzag edges possess magnetic edge states, with potential spintronics applications. Robustness of edge magnetism?
- Study of edge magnetism by several approaches: effective models, quantum Monte Carlo, density functional theory
- Collaboration with the group of Prof. Morgenstern and Prof. Stampfer (Institute IIB)



Graphene flake on Ir(111)



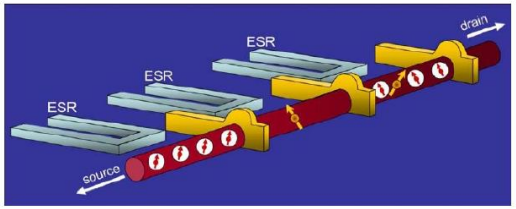
Institute for Theory of Statistical Physics

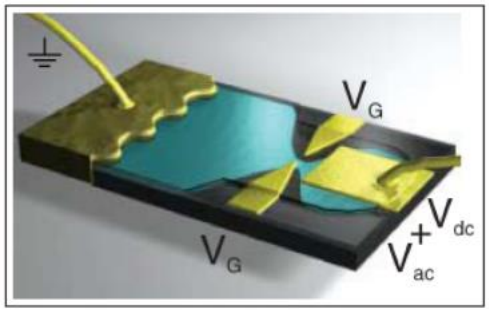
(Schoeller, Meden, Wegewijs)

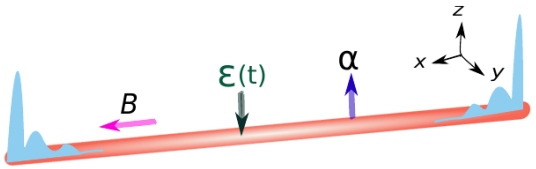
Themes: - Transport and many body effects in low dimensional and mesoscopic systems

- Topological systems

- Quantum field theoretical methods

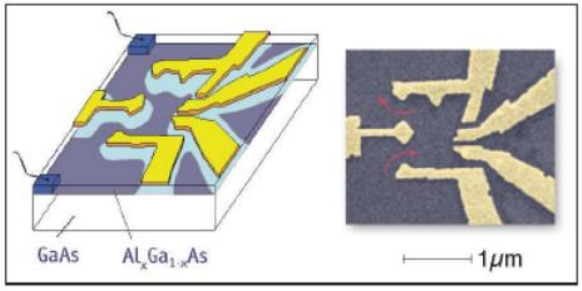


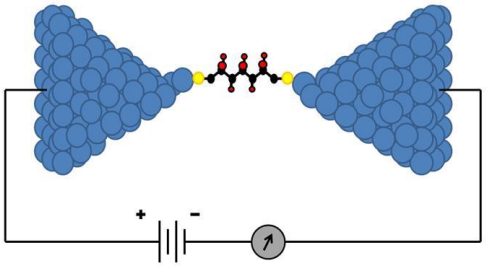


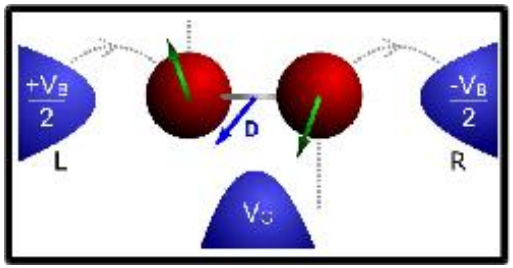


Transport in quantum dots and single-molecule junctions

- Many body effects: Kondo effect
- Non-equilibrium transport, spin-polarized transport
- Methods: renormalization group, Feynman diagrams, quantum kinetic equations
- Applications: molecular electronics, spintronics





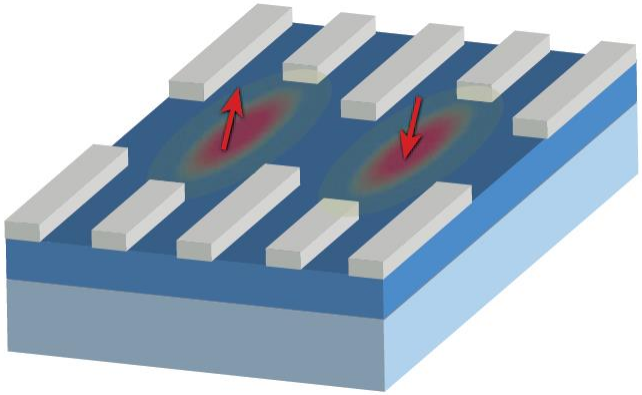


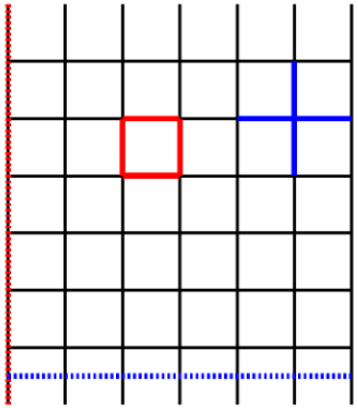
Institute for Quantum Information

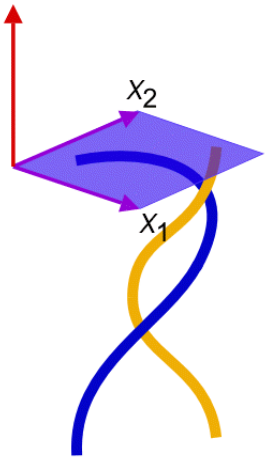
(D. DiVincenzo, F. Hassler)

Themes: - Solid-state based quantum information processing

- Topological quantum computation

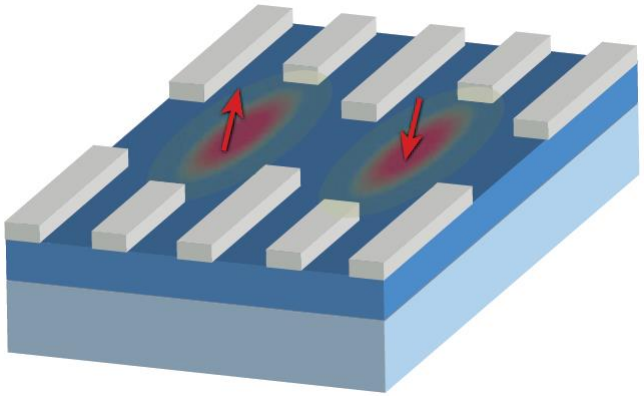


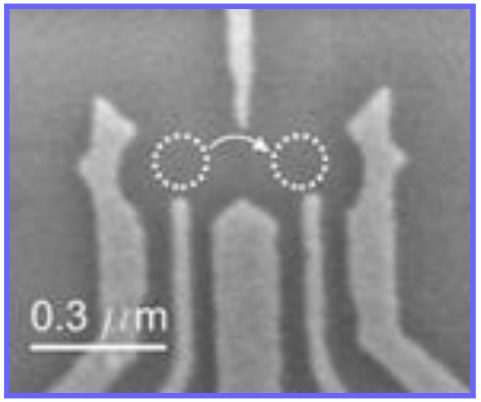


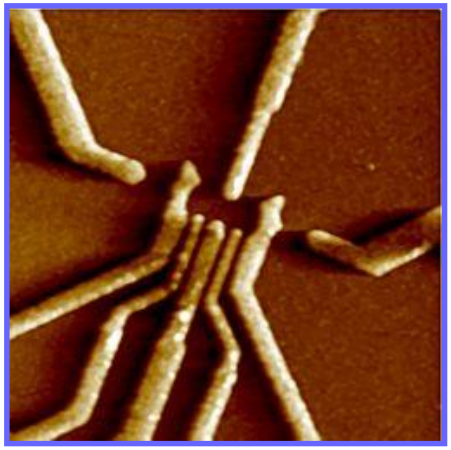


Quantum dots as spin qubits

- Spin of an electron confined in a quantum dot is a candidate for the realization of a qubit (Loss & DiVincenzo, PRA, 1998)
- Qubit operations implemented via local magnetic fields and gates
- Collaborations with the group of Prof. Bluhm (Institute IIC) and Prof. Stampfer (Institute IIB)







DFG research centers

Resistively Switching Chalcogenides for Future Electronics – Structure, Kinetics, and Device Scalability

Cluster of excellence involving RWTH Aachen University, University of Cologne, University of Bonn, and FZ Jülich

Research training group
Spokesperson: Volker Meden

Master's program: compulsory courses

1st term

- Quantum Theory of Condensed Matter I (Schoeller)
- Theoretical Solid State Physics (Mazzarello)

2nd term (1 course out of the following 4 must be chosen)

- Quantum Theory of Condensed Matter II (Schoeller)
- Quantum Information (DiVincenzo)
- Statistical Physics (Helias)
- Computational Physics (Michielsen & Mazzarello)

Theoretical Solid State Physics

Start: Monday 8 October (10:30), Room: 28B 110

- Structure of crystalline solids
- Electronic band structure
- Electron-electron interactions
- Phonons
- Magnetism
- Transport theory
- Modern theory of polarization

Quantum Theory of Condensed Matter I

Start: Thursday 11 October (8:30), Room: 28B 110

- Second quantization
- Green's functions
- Diagrammatic methods
- Linear response theory
- Many-body physics
- Superconductivity

Master's program: elective courses (1st term)

- Advanced Molecular Dynamics Simulations: Winkler

- Advanced Quantum Electronics and Quantum Information: Wegewijs & Pletyukhov

- Density Functional Theory and Electronic Structure: Blügel

- Statistical Mechanics of Neuronal Networks: Helias

- Symmetries and the Many Electron Problem: Pavarini
